# Handling Delimited Continuations with Dependent Types (Technical Appendix)

YOUYOU CONG, Ochanomizu University, Japan KENICHI ASAI, Ochanomizu University, Japan

This is a technical appendix of the authors' ICFP 2018 submission, containing:

- Proofs of metatheoretic properties of λ<sub>II</sub><sup>s/r</sup> (Section 1);
   Detailed discussion of the multi-arity extension (Section 2);
- Complete specification of  $\lambda_{\Pi}^{k}$  (Section 3);
- Proofs of type preservation of the CPS translation (Section 4); and
- CPS translation of the multi-ality language (Section 5).

# METATHEORETIC PROPERTIES OF $\lambda_{\Pi}^{s/r}$

This section proves a seriese of metatheoretic properties of  $\lambda_{\Pi}^{s/r}$ , including confluence, preservation, and progress.

### 1.1 Reduction

We first define parallel reduction, following Takahashi [1995]:

$$\frac{\Gamma \vdash t \triangleright_{p} t}{\Gamma \vdash h \triangleright_{p} t} (P\text{-Refl})$$

$$\frac{\Gamma \vdash A \triangleright_{p} A'}{\Gamma \vdash \Pi \times : A. * \triangleright_{p} \Pi \times : A'. *} (P\text{-PiK})$$

$$\frac{\Gamma \vdash e \triangleright_{p} e'}{\Gamma \vdash D e \triangleright_{p} D e'} (P\text{-DATA})$$

$$\frac{\Gamma \vdash A \triangleright_{p} A' \quad \Gamma \vdash B \triangleright_{p} B'}{\Gamma \vdash \Pi \times : A. B \triangleright_{p} \Pi \times : A'. B'} (P\text{-PiT1})$$

$$\frac{\Gamma \vdash A \triangleright_{p} A' \quad \Gamma \vdash \alpha \triangleright_{p} \alpha' \quad \Gamma \vdash B \triangleright_{p} B' \quad \Gamma \vdash \beta \triangleright_{p} \beta'}{\Gamma \vdash \Pi \times : A. \alpha \parallel B \parallel \beta \triangleright_{p} \Pi \times : A'. \alpha' \parallel B' \parallel \beta'} (P\text{-PiT2})$$

$$\frac{x = v : A \in \Gamma}{\Gamma \vdash x \triangleright_{p} v} (P\text{-VARDELTA})$$

$$\frac{\Gamma \vdash e \triangleright_{p} e'}{\Gamma \vdash \lambda \times : A. e \triangleright_{p} \lambda \times : A. e'} (P\text{-Abs})$$

$$\frac{\Gamma \vdash e \triangleright_{p} e'}{\Gamma \vdash rec f (x : A). e \triangleright_{p} rec f (x : A). e'} (P\text{-Rec})$$

Authors' addresses: Youyou Cong, Department of Computer Science, Ochanomizu University, Japan, so.yuyu@is.ocha.ac.jp; Kenichi Asai, Department of Computer Science, Ochanomizu University, Japan, asai@is.ocha.ac.jp.

$$\frac{\Gamma \vdash e_0 \triangleright_p e'_0 \quad \Gamma \vdash e_1 \triangleright_p e'_1}{\Gamma \vdash e_0 \models_p e'_0 e'_1} \quad (P\text{-}APP)$$

$$\frac{\Gamma \vdash e_0 \triangleright_p e'_0 \quad \Gamma \vdash \vee_1 \triangleright_p \vee_1'}{\Gamma \vdash (\lambda x : A, e_0) \vee_1 \triangleright_p e'_0 [V'_1/x]} \quad (P\text{-}APPBETA)$$

$$\frac{\Gamma \vdash e_0 \triangleright_p e'_0 \quad \Gamma \vdash \vee_1 \triangleright_p \vee_1'}{\Gamma \vdash (rec f (x : A), e_0) \vee_1 \triangleright_p e'_0 [rec f (x : A), e'_0/f, \vee_1'/x]} \quad (P\text{-}APPMU)$$

$$\frac{\Gamma \vdash e_1 \triangleright_p e'_1 \quad \Gamma, x : e_1 \vdash e_2 \triangleright_p e'_2}{\Gamma \vdash \text{let } x = e_1 : A \text{ in } e_2 \triangleright_p \text{ let } x = e'_1 : A \text{ in } e'_2} \quad (P\text{-}LET)$$

$$\frac{\Gamma \vdash v_1 \triangleright_p v'_1 \quad \Gamma, x : v_1 \vdash e_2 \triangleright_p e'_2}{\Gamma \vdash \text{let } x = v_1 : A \text{ in } e_2 \triangleright_p e'_2 [v'_1/x]} \quad (P\text{-}LETZETA)$$

$$\frac{\Gamma \vdash e \triangleright_p e'}{\Gamma \vdash c_1 e \triangleright_p c_1 e'} \quad (P\text{-}CONST)$$

$$\frac{\Gamma \vdash e \triangleright_p e'}{\Gamma \vdash c_1 e \triangleright_p c_1 e'} \quad (P\text{-}CONST)$$

$$\frac{\Gamma \vdash e \triangleright_p e'}{\Gamma \vdash v \triangleright_p v' \quad \Gamma \vdash e_1 \triangleright_p e'_1} \quad (P\text{-}MATCH)$$

$$\frac{\Gamma \vdash e \triangleright_p e'}{\Gamma \vdash Sk : A, e \triangleright_p Sk : A, e'} \quad (P\text{-}SHIFT)$$

$$\frac{\Gamma \vdash e \triangleright_p e'}{\Gamma \vdash (e) \triangleright_p (e')} \quad (P\text{-}RESETB)$$

$$\frac{\Gamma \vdash F[x] \triangleright_p f'[x] \quad \Gamma \vdash e \triangleright_p e'}{\Gamma \vdash (x) \triangleright_p (e')} \quad (P\text{-}RESETS)$$

$$\frac{\Gamma \vdash v \triangleright_p v'}{\Gamma \vdash (y) \triangleright_p v'} \quad (P\text{-}RESETR)$$

Lemma 1.1 (Substitution and Parallel Reduction). If  $\Gamma \vdash t \triangleright_p t'$  and  $\Gamma \vdash v \triangleright_p v'$ , then  $\Gamma \vdash t [v/x] \triangleright_p t' [v'/x]$ .

The proof is by induction on the derivation of  $\Gamma \vdash t \triangleright_p t'$ .

Case (Refl)

Sub-Case t = x

Our goal is to show:

$$\Gamma \vdash x [v/x] \triangleright_{p} x [v'/x]$$

This immediately follows by the premise.

**Sub-Case** t = y where  $y \neq x$ 

Trivial.

Case (APPREDBETA)

Our goal is to show:

$$\Gamma \vdash ((\lambda x : A. e_0) v_1) [v/x'] \triangleright_{p} (e'_0 [v'_1/x]) [v'/x']$$

By the induction hypothesis, we have

$$\Gamma \vdash e_0[v/x'] \triangleright_p e'_0[v'/x']$$

and

$$\Gamma \vdash v_1[v/x'] \triangleright_p v'_1[v'/x']$$

The goal follows by (APPREDBETA).

LEMMA 1.2 (CONFLUENCE OF  $\triangleright_p$ ). If  $\Gamma \vdash e \triangleright_p e_1$  and  $\Gamma \vdash e \triangleright_p e_2$ , then there exists some e' such that  $\Gamma \vdash e_1 \triangleright_p e'$  and  $\Gamma \vdash e_2 \triangleright_p e'$ .

The proof is by induction on the structure of e.

Case e = x

**Sub-Case** One reduction is (P-Refl.)

Trivial.

**Sub-Case** Both reduction is (P-VARDELTA)

This case is also trivial.

Case  $e = e_0 e_1$ 

**Sub-Case** One reduction is (P-Refl.)

Trivial

**Sub-Case** Both reductions are (P-APP)

In this case, we have

 $e_0 e_1 \triangleright_p e_{00} e_{10}$ 

and

$$e_0 e_1 \triangleright_p e_{01} e_{11}$$

By the induction hypothesis, there exists some  $e'_0$  such that  $e_{00} \triangleright_p e'_0$  and  $e_{01} \triangleright_p e'_0$ . We have a similar  $e'_1$ . By (P-APP), we obtain  $e_{00} e_{10} \triangleright_p e'_0 e'_1$  and  $e_{01} e_{11} \triangleright_p e'_0 e'_1$  as desired.

**Sub-Case** One reduction is (P-AppBeta)

In this case, e must have the form  $(\lambda x : A. e_0) v_1$ .

**Sub-Sub-Case** The other reduction is (P-APP)

We have

$$(\lambda x : A. e_0) v_1 \triangleright_p e_{00} [v_{10}/x]$$

and

$$(\lambda x : A. e_0) v_1 \triangleright_{p} (\lambda x : A. e_{01}) v_{11}$$

By the induction hypothesis, there is a  $e'_0$  such that  $e_{00} \triangleright_p e'_0$  and  $e_{01} \triangleright_p e'_0$ . We also have a similar  $v'_1$ . By Lemma 1.1, we have  $e_0[v_1/x] \triangleright_p e'_0[v'_1/x]$ . By (P-AppBeta), we also have  $(\lambda x : A. e_{01}) v_{11} \triangleright_p e'_0[v'_1/x]$ . These imply the goal.

Sub-Sub-Case The other reduction is (P-AppBeta)

We have

$$(\lambda x : A. e_0) v_1 \triangleright_{p} e_{00} [v_{10}/x]$$

and

$$(\lambda x : A. e_0) v_1 \triangleright_p e_{01} [v_{11}/x]$$

By the induction hypothesis, there is a  $e'_0$  such that  $e_{00} \triangleright_p e'_0$  and  $e_{01} \triangleright_p e'_0$ . We also have a similar  $v'_1$ . By Lemma 1.1, we have  $e_{00} [v_{10}/x] \triangleright_p e'_0 [v'_1/x]$  and  $e_{01} [v_{11}/x] \triangleright_p e'_0 [v'_1/x]$ . The goal follows by (P-AppBeta).

**Sub-Case** One reduction is (P-APPMU)

This case is analogous to the previous case.

Case  $e = let x = e_1 : A in e_2$ 

**Sub-Case** One reduction is (P-Refl.)

Trivial.

**Sub-Case** Both reductions are (P-Let)

In this case, we have

let 
$$x = e_1 : A \text{ in } e_2 \triangleright_p \text{ let } x = e_{10} : A \text{ in } e_{20}$$

and

let 
$$x = e_1 : A \text{ in } e_2 \triangleright_p \text{ let } x = e_{11} : A \text{ in } e_{21}$$

By the induction hypothesis, there is a  $e_1'$  such that  $e_{10} \triangleright_p e_1'$  and  $e_{11} \triangleright_p e_1'$ . We also have a similar  $e_2'$ . The goal follows by (P-Let).

**Sub-Case** One reduction is (P-LetZetA)

In this case, e must have the form let  $x = v_1 : A$  in  $e_2$ .

**Sub-Sub-Case** The other reduction is (P-Let)

We have

let 
$$x = v_1 : A \text{ in } e_2 \triangleright_p e_{20} [v_{10}/x]$$

and

let 
$$x = v_1 : A \text{ in } e_2 \triangleright_p \text{ let } x = v_{11} : A \text{ in } e_{21}$$

By the induction hypothesis, there is a  $e_1'$  such that  $e_{10} >_p e_1'$  and  $e_{11} >_p e_1'$ . We also have a similar  $e_2'$ . By Lemma 1.1, we have  $e_2 [v_1/x] >_p e_2' [v_1'/x]$ . By (P-LetZeta), we also have let  $x = v_{11} : A$  in  $e_{21} >_p e_2' [v_1'/x]$ . These imply the goal.

**Sub-Sub-Case** The other reduction is (P-LetZeta)

let 
$$x = v_1$$
 in  $Ae_2 \triangleright_p e_{20} [v_{10}/x]$ 

and

let 
$$x = v_1$$
 in  $Ae_2 \triangleright_p e_{21} [v_{11}/x]$ 

By the induction hypothesis, there is a  $e_1'$  such that  $e_{10} \triangleright_p e_1'$  and  $e_{11} \triangleright_p e_1'$ . We also have a similar  $e_2'$ . By Lemma 1.1, we have  $e_{20} [v_{10}/x] \triangleright_p e_2' [v_1'/x]$  and  $e_{21} [v_{11}/x] \triangleright_p e_2' [v_1'/x]$ . These imply the goal.

Case e = match e as x in D a return P with  $\{c_i \ y_i \rightarrow e_i\}$ 

**Sub-Case** One reduction is (P-Refl.)

Trivial

**Sub-Case** Both reduction is (P-MATCH)

We have

match e as x in D a return P with  $\{c_i \ y_i \to e_i\} \triangleright_p \text{ match } e_0 \text{ as x in D a return P with } \{c_i \ y_i \to e_{i0}\}$ and

match e as x in D a return P with  $\{c_i \ y_i \rightarrow e_i\} \triangleright_p \text{ match } e_1 \text{ as x in D a return P with } \{c_i \ y_i \rightarrow e_{i1}\}$ 

By the induction hypothesis, there is a e' such that  $e_0 \triangleright_p e'$  and  $e_1 \triangleright_p e'$ . We have a similar  $e_i'$ . The goal follows by (P-MATCH).

**Sub-Case** One reduction is (P-MATCHIOTA)

In this case, e must have the form match  $c_i$  v as x in D a return P with  $\{c_i \ y_i \rightarrow e_i\}$ .

**Sub-Sub-Case** The other reduction is (P-MATCH)

We have

match  $c_i$  v as x in D a return P with  $\{c_i \ y_i \rightarrow e_i\} \triangleright_p e_{i0} [v_0/y_i]$ 

and

match  $c_i$  v as x in D a return P with  $\{c_i y_i \rightarrow e_i\} \triangleright_p \text{ match } c_i v_1 \text{ as x in D a return P with } \{c_i y_i \rightarrow e_{i1}\}$ 

By the induction hypothesis, there is a v' such that  $v_0 \triangleright_p v'$  and  $v_1 \triangleright_p v'$ . We have a similar  $e_i'$ . By Lemma 1.1, we have  $e_{i0} [v_0/y_i] \triangleright_p e_i' [v'/y_i]$ . By (P-MATCHIOTA), we also have match  $c_i v_1$  as x in D a return P with  $\{c_i y_i \rightarrow e_{i1}\} \triangleright_p e_i' [v'/y_i]$ . These imply the goal.

**Sub-Sub-Case** The other reduction is (P-MATCHIOTA)

We have

match  $c_i$  v as x in D a return P with  $\{c_i \ y_i \rightarrow e_i\} \triangleright_p e_{i0} [v_0/y_i]$ 

and

match  $c_i$  v as x in D a return P with  $\{c_i \ y_i \rightarrow e_i\} \triangleright_p e_{i1} [v_1/y_i]$ 

By the induction hypothesis, there is a v' such that  $v_0 \triangleright_p v'$  and  $v_1 \triangleright_p v'$ . We have a similar  $e_i'$ . By Lemma 1.1, we have  $e_{i0} [v_0/y_i] \triangleright_p e_i' [v'/y_i]$  and  $e_{i1} [v_1/y_i] \triangleright_p e_i' [v'/y_i]$ . These imply the goal.

Case  $e = \langle e \rangle$ 

**Sub-Case** One reduction is (P-Refl)

Trivial.

**Sub-Case** Both reductions are (P-RESET)

We have

 $\langle e \rangle \triangleright_{p} \langle e_{0} \rangle$ 

and

$$\langle e \rangle \triangleright_{p} \langle e_{1} \rangle$$

By the induction hypothesis, there is a e' such that  $e_0 \triangleright_p e'$  and  $e_1 \triangleright_p e'$ . The goal follows by (P-RESET).

**Sub-Case** One reduction is (P-RESETS)

In this case, e must have the form  $\langle F[Sk : A \rightarrow \alpha. e] \rangle$ .

**Sub-Sub-Case** The other reduction is (P-RESET)

We have

$$\langle F[Sk:A \rightarrow \alpha.e] \rangle \triangleright_{p} \langle e_0 [\lambda x:A.\langle F_0[x] \rangle/k] \rangle$$

and

$$\langle F[Sk:A \rightarrow \alpha.e] \rangle \triangleright_{p} \langle F_{1}[Sk:A \rightarrow \alpha.e_{1}] \rangle$$

By the induction hypothesis, there is a F' such that  $F_0[x] \triangleright_p F'[x]$  and  $F_1[x] \triangleright_p F'[x]$ . We have a similar e'. By Lemma 1.1, we have  $\langle e_0 [\lambda x : A. \langle F_0[x] \rangle / k] \rangle \triangleright_p \langle e' [\lambda x : A. \langle F'[x] \rangle / k] \rangle$  (note that F[e] = F[x] [e/x]). By (P-RESETS), we also have  $\langle F_1[Sk : A \rightarrow \alpha. e_1] \rangle \triangleright_p \langle e' [\lambda x : A. \langle F'[x] \rangle / k] \rangle$ . These imply the goal.

**Sub-Case** The other reduction is (P-RESETS)

We have

$$\langle F[Sk:A \rightarrow \alpha.e] \rangle \triangleright_{p} \langle e_0 [\lambda x:A.\langle F_0[x] \rangle/k] \rangle$$

and

$$\langle F[Sk:A \rightarrow \alpha.e] \rangle \triangleright_{p} \langle e_{1}[\lambda x:A.\langle F_{1}[x] \rangle/k] \rangle$$

By the induction hypothesis, there is a F' such that

 $F_0[x] \triangleright_p F'[x]$  and  $F_1[x] \triangleright_p F'[x]$ . We have a similar e'. By Lemma 1.1, we have  $\langle e_0 [\lambda x : A. \langle F_0[x] \rangle / k] \rangle \triangleright_p \langle e' [\lambda x : A. \langle F'[x] \rangle / k] \rangle$  and  $\langle e_1 [\lambda x : A. \langle F_1[x] \rangle / k] \rangle \triangleright_p \langle e' [\lambda x : A. \langle F'[x] \rangle / k] \rangle$ . This implies the goal.

**Sub-Case** One reduction is (P-RESETR)

In this case, e must have the form  $\langle v \rangle$ .

**Sub-Sub-Case** The other reduction is (P-RESET)

We have

$$\langle v \rangle \triangleright_{p} v_{0}$$

and

$$\langle v \rangle \triangleright_p \langle v_1 \rangle$$

By the induction hypothesis, there is a v' such that  $v_0 \triangleright_p v'$  and  $v_1 \triangleright_p v'$ . The goal follows by (P-RESETR).

**Sub-Sub-Case** The other reduction is (P-RESETR)

We have

$$\langle v \rangle \triangleright_p v_0$$

and

$$\langle v \rangle \triangleright_{p} v_{1}$$

By the induction hypothesis, there is a v' such that  $v_0 \triangleright_p v'$  and  $v_1 \triangleright_p v'$ . This implies the goal.

LEMMA 1.3 (CONFLUENCE OF  $\triangleright^*$ ). If  $\Gamma \vdash e \triangleright^* e_1$  and  $\Gamma \vdash e \triangleright^* e_2$ , then there exists some e' such that  $\Gamma \vdash e_1 \triangleright^* e'$  and  $\Gamma \vdash e_2 \triangleright^* e'$ .

This is the consequence of the confluence lemma (Lemma 1.2); note that  $\triangleright^*$  is the transitive closure of  $\triangleright_p$ .

Lemma 1.4 (Transitivity of Equivalence). If  $t \equiv t'$  and  $t' \equiv t''$ , then  $t \equiv t''$ .

Suppose we have (i)  $t \equiv t''$  where  $t \triangleright^* t_0$  and  $t \triangleright^* t_0$ ; and (ii)  $t' \equiv t''$  where  $t' \triangleright^* t_1$  and  $t' \triangleright^* t_1$ . By Lemma 1.3, there is a  $t_2$  such that  $t_0 \triangleright_p t_2$  and  $t_1 \triangleright_p t_2$ . This implies  $t \triangleright^* t''$ .

#### 1.2 Substitution

LEMMA 1.5 (SUBSTITUTION).

- (1) If  $\vdash \Gamma$ , x : A',  $\Gamma'$  and  $\Gamma \vdash_p e' : A'$ , then  $\vdash \Gamma$ ,  $\Gamma'$  [e'/x].
- (2) If  $\Gamma, x : A', \Gamma' \vdash A : * and \Gamma \vdash_p e' : A'$ , then  $\Gamma, \Gamma' [e'/x] \vdash A [e'/x] : *$ .
- (3) If  $\Gamma, x : A', \Gamma' \vdash_{p} e : A \text{ and } \Gamma \vdash_{p} e' : A', \text{ then } \Gamma, \Gamma' [e'/x] \vdash_{p} e [e'/x] : A [e'/x].$
- (4) If  $\Gamma$ , x : A',  $\Gamma'$ ;  $\alpha \vdash e : B$ ;  $\beta$  and  $\Gamma \vdash_p e' : A'$ , then  $\Gamma$ ,  $\Gamma'$  [e'/x];  $\alpha$   $[e'/x] \vdash_e [e'/x] : B[e'/x]$ ;  $\beta$  [e'/x].

The proof is by mutual induction on the derivation of A and e.

Case Part 1

Sub-Case (EMPTY) Immediate.

Sub-Case (EXTEND1) Our goal is to show:

$$\vdash \Gamma, \Gamma' [e'/x'], x : A [e'/x']$$

By Parts 1 and 2 of the induction hypothesis, we have

$$\vdash \Gamma, \Gamma' [e'/x']$$

and

$$\Gamma,\Gamma'[e'/x'] \vdash A[e'/x']:*$$

The goal follows by (EXTEND1).

Sub-Case (EXTEND2) Our goal is to show:

$$\vdash \Gamma, \Gamma'[e'/x'], x = e[e'/x'] : A[e'/x']$$

By Parts 1 and 3 of the induction hypothesis, we have

$$\vdash \Gamma, \Gamma' [e'/x]$$

and

$$\Gamma, \Gamma'[e'/x] \vdash_{p} e[e'/x] : A[e'/x]$$

The goal follows by (EXTEND2).

Case Part 2

Sub-Case (DATA) Our goal is to show:

$$\Gamma, \Gamma'[e'/x] \vdash (De)[e'/x] : *$$

By Part 3 of the induction hypothesis, we have

$$\Gamma, \Gamma'[e'/x] \vdash_{p} e[e'/x] : A[e'/x]$$

The goal follows by (DATA).

Case Part 3

Sub-Case (VAR)

**Sub-Sub-Case** e = x Our goal is to show:

$$\Gamma$$
,  $\Gamma'[e'/x] \vdash_{p} x[e'/x] : A[e'/x]$ 

By the definition of substitution and well-formed typing environments, the goal reduces to:

$$\Gamma, \Gamma'[e'/x] \vdash_{n} e' : A$$

which follows by the premise.

**Sub-Sub-Case** e = y where  $y \neq x$  Our goal is to show:

$$\Gamma$$
,  $\Gamma'[e'/x] \vdash_{p} y[e'/x] : A[e'/x]$ 

By the induction hypothesis, we have either of the following:

$$\Gamma, \Gamma'[e'/x] \vdash A[e'/x] : *$$

$$\Gamma$$
,  $\Gamma'[e'/x] \vdash_{p} e[e'/x] : A[e'/x]$ 

The goal follows by (VAR).

Sub-Case (APP1) Our goal is to show:

$$\Gamma, \Gamma' \left[ e'/x' \right] \vdash_{p} \left( e_0 \; e_1 \right) \left[ e'/x' \right] : \left( B \left[ e_1/x \right] \right) \left[ e'/x' \right]$$

By the induction hypothesis, we have

$$\Gamma, \Gamma'[e'/x'] \vdash_{p} e_{0}[e'/x'] : (\Pi x : A. B)[e'/x']$$

and

$$\Gamma, \Gamma'[e'/x'] \vdash_{p} e_{1}[e'/x'] : A[e'/x']$$

By the definition of substitution, we have

$$(e_0 e_1) [e'/x'] = (e_0 [e'/x']) (e_1 [e'/x'])$$

We also know that

$$(B[e_1/x])[e'/x'] = (B[e_1[e'/x]/x])[e'/x']$$

These imply the goal.

**Sub-Case** (Reset2) Our goal is to show:

$$\Gamma, \Gamma'[e'/x] \vdash_{p} \langle e \rangle [e'/x] : A[e'/x]$$

By Part 4 of the induction hypothesis, we have

$$\Gamma, \Gamma'[e'/x]; B[e'/x] + e : B[e'/x]; A[e'/x]$$

The goal follows by (RESET2).

Case Part 4

**Sub-Case** (APP5) Our goal is to show:

$$\Gamma, \Gamma'[e'/x']; (\alpha[e_1/x])[e'/x'] \vdash (e_0 e_1)[e'/x'] : (B[e_1/x])[e'/x']; (\beta[e_1/x])[e'/x']$$

By Part 3 of the induction hypothesis, we have

$$\Gamma$$
,  $\Gamma'[e'/x'] \vdash_{p} e_0[e'/x'] : (\Pi x : A.  $\alpha \parallel B \parallel \beta)[e'/x']$$ 

and

$$\Gamma, \Gamma'[e'/x'] \vdash_{p} e_{1}[e'/x'] : A[e'/x']$$

The goal follows by (APP5).

Sub-Case (Exp) Our goal is to show:

$$\Gamma$$
,  $\Gamma'$  [e'/x'];  $\alpha$  [e'/x']  $\vdash$  e [e'/x'] : A [e'/x'];  $\alpha$  [e'/x']

By Parts 3 and 2 of the induction hypothesis, we have

$$\Gamma$$
,  $\Gamma'[e'/x'] \vdash_{p} e[e'/x'] : A[e'/x']$ 

$$\Gamma$$
,  $\Gamma'[e'/x'] \vdash \alpha[e'/x'] : *$ 

The goal follows by (Exp).

## 1.3 Regularity

(1) If  $\Gamma \vdash \kappa$  then  $\vdash \Gamma$ .

LEMMA 1.6 (CONTEXT REGULARITY).

```
(2) If \Gamma \vdash A : * then \vdash \Gamma.
  (3) If \Gamma \vdash_{p} e : A \text{ or } \Gamma; \alpha \vdash e : A; \beta \text{ then } \vdash \Gamma.
  The proof is by mutual induction on the derivation of \kappa, A, and e. We show some representative
cases:
    Case Part 1
    Sub-Case (STAR) Trivial.
    Sub-Case (PiK) The goal follows by Part 2 of the induction hypothesis.
    Case Part 2
    Sub-Case (DATA) The goal follows by Part 3 of the induction hypothesis.
    Sub-Case (P11) The goal follows by the induction hypothesis.
    Case Part 3
    Sub-Case (VAR) Trivial.
    Sub-Case (CONV) The goal follows by the induction hypothesis.
  Lemma 1.7 (Context Inversion). If \vdash \Gamma and x : A \in \Gamma or x = e \in \Gamma, then \Gamma \vdash A : *.
  The proof is by induction on the derivation of \Gamma.
    Case (EXTEND1)
    Sub-Case \Gamma = \Gamma', x : A
       The goal follows by the premise of (EXTEND1).
    Sub-Case \Gamma = \Gamma', y : B
       The goal follows by the induction hypothesis applied to \Gamma'.
    Case (Extend2)
    Sub-Case \Gamma = \Gamma', x = e : A
       The goal follows by the premise of (EXTEND2).
    Sub-Case \Gamma = \Gamma', y : B
       The goal follows by the induction hypothesis applied to \Gamma'.
  LEMMA 1.8 (REGULARITY).
  (1) If \Gamma \vdash_p e : A, then \Gamma \vdash A : *.
  (2) If \Gamma; \alpha \vdash e : A; \beta, then \Gamma \vdash A : *.
   The proof is by mutual induction on the derivation of e.
    Case Part 1
    Sub-Case (VAR)
       The goal follow by the context inversion lemma (Lemma 1.7).
    Sub-Case (ABS1)
       By Part 1 of the induction hypothesis, we have \Gamma, x : A \vdash B : *. By context regularity (Lemma
       1.6), we also have \vdash \Gamma, x : A, and by context inversion (Lemma 1.7), we obtain \Gamma \vdash A : *. By
       (P11), we can conclude that \Gamma \vdash \Pi \times A.B : *.
    Sub-Case (Let1)
       By Part 1 of the induction hypothesis, we have \Gamma, x = e_1 : A \vdash B : *. The substitution lemma
       (Lemma 1.5) gives us \Gamma \vdash B[e_1/x] : *, which is what we want.
    Case Part 2
```

### Sub-Case (Shift)

By the typing rule, we have  $\Gamma$ ,  $k: A \to \alpha$ ;  $B \vdash e: B$ ;  $\beta$ . The context regularity lemma (Lemma 1.6) gives us  $\vdash \Gamma$ ,  $k: A \to \alpha$ , and by applying the context inversion lemma (Lemma 1.7), we obtain  $\Gamma \vdash A \to \alpha: *$ , which implies  $\Gamma \vdash A: *$  and  $\Gamma \vdash \alpha: *$ . Together with the premise  $\Gamma \vdash \beta: *$ , we obtain the expected property.

## Sub-Case (Exp)

By Part 1 of the induction hypothesis, we have  $\Gamma \vdash A : *$ . The premise of (Exp) also gives us  $\Gamma \vdash \alpha : *$ . These complete the proof.

#### 1.4 Preservation

Lemma 1.9 (Inversion for Abstraction). If  $\Gamma \vdash_p \lambda x : A.e : C$ , then either (1) or (2) holds.

- (1)  $C \equiv \Pi \times A. B$  for some B, and  $\Gamma, \times A \vdash_p e : B$ .
- (2)  $C \equiv \Pi x : A. \alpha \parallel B \parallel \beta$  for some B,  $\alpha$ , and  $\beta$ , and  $\Gamma$ , x : A;  $\alpha \vdash e : B$ ;  $\beta$ .

Lemma 1.10 (Inversion for Recursive Functions). If  $\Gamma \vdash_p \operatorname{rec} f(x : A)$ . e : C, then either (1) or (2) holds.

- (1)  $C \equiv \Pi \times A. B$  for some B, and  $\Gamma, \times A \vdash_p e : B$ .
- (2)  $C \equiv \Pi x : A. \alpha \parallel B \parallel \beta$  for some B,  $\alpha$ , and  $\beta$ , and  $\Gamma$ , x : A;  $\alpha \vdash e : B$ ;  $\beta$ .

LEMMA 1.11 (INVERSION FOR INDUCTIVE DATA). If  $\Gamma \vdash_p c_i e : C \text{ or } \Gamma; \alpha \vdash c_i e : C; \beta, \text{ then } C \equiv D u_i, \text{ where } Ind(D : \Pi a : A. *, \{c_i : \Pi y_i : B_i. D u_i\}) \in \Psi, \Gamma \vdash_p u_i : A, \text{ and } \Gamma \vdash_p e : B_i \text{ or } \Gamma; \alpha \vdash e : B_i; \beta.$ 

LEMMA 1.12 (Inversion for Shift). If  $\Gamma$ ;  $\alpha \vdash Sk : K.e : C$ ;  $\beta$ , then  $C \equiv A$ ,  $K \equiv A \rightarrow \alpha'$ ,  $\Gamma$ ,  $k : A \rightarrow \alpha'$ ;  $B \vdash e : B$ ;  $\beta'$  for some A, B,  $\alpha'$ , and  $\beta'$  such that  $\alpha \equiv \alpha'$  and  $\beta \equiv \beta'$ .

Lemma 1.13 (Purity of Values). If  $\Gamma$ ;  $\alpha \vdash v : A$ ;  $\beta$ , then  $\alpha \equiv \beta$  and  $\Gamma \vdash_p v : A$ .

Since all the typing rules for values conclude with a  $\vdash_p$ -judgment, we know that the two answer types are introduced by rule (Exp), and that  $\alpha \equiv \beta$ . This implies the goal.

THEOREM 1.14 (PRESERVATION).

- (1) If  $\Gamma \vdash_p e : A \ and \ e \triangleright e'$ , then  $\Gamma \vdash_p e' : A$ .
- (2) If  $\Gamma$ ;  $\alpha \vdash e : A$ ;  $\beta$  and  $e \vdash e'$ , then  $\Gamma$ ;  $\alpha \vdash e' : A$ ;  $\beta$ .

The proof is by induction on the derivation of e. We show several representative cases.

#### Case Part 1

### Sub-Case (VAR)

The only reduction rule that we can apply to a variable is the  $\delta$  rule. When this rule is applicable, we know that the typing environment has a binding of the form x = v : A. The goal immediately follows.

Sub-Case (APP1)

Sub-Sub-Case  $e_0 e_1 \triangleright e_0 e'_1$ 

Our goal is to show:

$$\Gamma \vdash_{p} e_0 e'_1 : B [e_1/x]$$

By Part 1 of the induction hypothesis, we have  $\Gamma \vdash_p e_1' : A$ . By (APP1), we also have  $\Gamma \vdash_p e_0 e_1' : B[e_1'/x]$ . Since  $e_1 \triangleright e_1'$ , we have  $B[e_1'/x] \equiv B[e_1/x]$ . The goal follows by (Conv1).

**Sub-Sub-Case**  $(\lambda x : A. e) \lor e [v/x]$ 

Our goal is to show:

$$\Gamma \vdash_{p} e[v/x] : B[v/x]$$

By Lemma 1.9, we have  $\Gamma$ ,  $x : A \vdash_p e : B$ . The goal follows by the substitution lemma (Lemma 1.5).

Sub-Case (MATCH1)

**Sub-Sub-Case** match e as x in D a return P with  $\{c_i \ y_i \rightarrow e_i\}$ 

match e' as x in D a return P with  $\{c_i \ y_i \rightarrow e_i\}$ 

Our goal is to show:

$$\Gamma \vdash_{p}$$
 match e' as x in D a return P with  $\{c_i \ y_i \rightarrow e_i\} : P[u/a, e/x]$ 

By Part 1 of the induction hypothesis, we have  $\Gamma \vdash_p e' : D$  u. By (MATCH1), we also have  $\Gamma \vdash_p \text{ match } e'$  as x in D a return P with  $\{c_i \ y_i \rightarrow e_i\} : P[u/a, e'/x]$ . Since  $e \triangleright e'$ , the goal follows by (CONV1).

**Sub-Sub-Case** match  $c_i$  v as x in D a return P with  $\{c_i \ y_i \rightarrow e_i\} \triangleright e_i [v/y_i]$ 

Our goal is to show:

$$\Gamma \vdash_{p} e_{i} [v/y_{i}] : P[u/a, c_{i} v/x]$$

By inversion for inductive data and pattern matching (Lemmas 1.11 and ??), we have  $\Gamma \vdash_p c_i \lor : D \lor u$  and  $\Gamma, \lor q_i : A_i \vdash_p e_i : D \lor u_i$ . The goal follows by Lemma 1.5.

Sub-Case  $\langle e \rangle \triangleright \langle e' \rangle$ 

Our goal is to show:

$$\Gamma \vdash_{p} \langle e' \rangle : A$$

By (Reset), we have  $\Gamma$ ; B  $\vdash$  e : B; A. By Part 2 of the induction hypothesis, we also have  $\Gamma$ ; B  $\vdash$  e' : B; A. This implies the goal.

Sub-Case ⟨v⟩ ▷ v

Our goal is to show:

$$\Gamma \vdash_{p} \mathsf{v} : \mathsf{A}$$

By (Reset), we have  $\Gamma$ ; B  $\vdash$  v : B; A. By Lemma 1.13, we must have a derivation  $\Gamma \vdash_p v$  : B, and A and B must be equivalent. These imply the goal.

**Sub-Case** 
$$\langle F[Sk:A' \rightarrow \alpha.e] \rangle \triangleright \langle e[\lambda x:A'.\langle F[x] \rangle/k] \rangle$$

Our goal is to show:

$$\Gamma \vdash_{p} \langle e[\lambda x : A', \langle F[x] \rangle / k] \rangle : A$$

Following Asai and Kameyama [2007], we prove this case by decomposing the reduction into small reductions, which captures one context frame at a time. That is, we refine the reduction rule of shift as follows:

**Sub-Sub-Case** ( $Sk:\Pi x:A'.B'\to \alpha'.e$ )  $e_1 \triangleright Sk':B'[e_1/x]\to \alpha'.e[\lambda v:\Pi x:A'.B'.\langle k'(ve_1)\rangle/k]$  The application must be derived by (APP3), (APP4), or (CONV2). We consider the first case. Our goal is to show:

```
\Gamma; \alpha \vdash Sk' : B'[e_1/x] \rightarrow \alpha' . e[\lambda v : \Pi x : A' . B' . \langle k'(v e_1) \rangle / k] : B[e_1/x]; \beta
```

**Sub-Sub-Case**  $\langle Sk : A' \rightarrow \alpha' . e \rangle \triangleright e [\lambda v : A' . v/k]$ 

By (Reset), we know that  $\Gamma$ ; B'  $\vdash Sk : A' \to \alpha'$ . e : B'; A. By inversion for shift (Lemma 1.12), we also know that B'  $\equiv A_1, A' \to \alpha' \equiv A_1 \to \alpha, \Gamma, k : A_1 \to \alpha$ ; B  $\vdash$  e : B;  $\beta$ , B'  $\equiv \alpha$ , and  $A \equiv \beta$ .

It is easy to see that  $\lambda v : A' \cdot v$  has type  $A' \to A'$ . We must show this type is equivalent to  $A_1 \to \alpha$ . The equivalence  $A' \to \alpha' \equiv A_1 \to \alpha$  implies  $A' \equiv A_1$  and  $\alpha' \equiv \alpha$ . By transitivity of  $\equiv$  (Lemma 1.4), we also have  $A_1 \equiv \alpha$ . This means substitution of  $\lambda v : A' \cdot v$  for k is type-safe. The goal now follows by  $A \equiv \beta$ .

### 1.5 Progress

LEMMA 1.15 (CANONICAL FORMS).

- (1) If  $\bullet \vdash_p \lor : \Pi \times : A. B \text{ or } \bullet \vdash_p \lor : \Pi \times : A. \alpha \parallel B \parallel \beta$ , then  $\lor$  is of the form  $\lambda \times : A'. e$  or rec f (x : A'). e.
- (2) If  $\bullet \vdash_{p} v : D u$ , then v is of the form  $c_i v'$ .

THEOREM 1.16 (PROGRESS).

- (1) If  $\bullet \vdash_p e : A$ , then either e is a value, or there is a e' such that  $e \blacktriangleright e'$ .
- (2) If  $\bullet$ ;  $\alpha \vdash e : A$ ;  $\beta$ , then e is a value, or there is a e' such that  $e \blacktriangleright e'$ , or it is a stuck term of the form  $F[Sk : \_.e']$ .

The proof is by induction on the derivation of e. The progress property in the usual sense holds only for pure terms, because impure terms are not executable in general (e.g., a shift clause is a stuck term).

Case Part 1

Sub-Case (VAR)

This case is impossible since no variable is well-typed under an empty context.

**Sub-Case** (ABS1), (ABS2), (REC1), (REC2)

These cases are trivial since functions are values.

Sub-Case (APP1)

By Part 1 of the induction hypothesis, we know  $e_0$  is either a value or there is a  $e_0'$  such that  $e_0 \triangleright e_0'$ , and similarly for  $e_1$ . If  $e_0$  is a value, we know from Lemma 1.15 that it has the form  $\lambda \times : A' \cdot e_0'$ . If  $e_1$  is also a value, the application is a  $\beta$ -redex. If  $e_1$  is a non-value,  $e_0 e_1 \triangleright e_0 e_1'$ . If  $e_0$  is a non-value,  $e_0 e_1 \triangleright e_0' e_1$ .

## Sub-Case (MATCH1)

By Part 1 of the induction hypothesis, we know e is either a value, or there is a e' such that  $e \triangleright e'$ . In the first case, we know from Lemma 1.15 that e is of the form  $c_i$  v. Therefore match e as x in D a return P with  $\{c_i \ y_i \rightarrow e_i\} \triangleright e_i \ [v/y_i]$ . In the second case, match e as x in D a return P with  $\{c_i \ y_i \rightarrow e_i\} \triangleright \text{match } e'$  as x in D a return P with  $\{c_i \ y_i \rightarrow e_i\}$ .

## Sub-Case (RESET)

By Part 2 of the induction hypothesis, we know e is either a value, or there is a e' such that  $e \triangleright e'$ , or it is a stuck term of the form  $F[Sk:\_.e']$ . In the first case,  $\langle e \rangle \triangleright e$ . In the second case,  $\langle e \rangle \triangleright \langle e' \rangle$ . In the last case,  $\langle e \rangle \triangleright \langle e' | \lambda x:\_.\langle F[x] \rangle / k] \rangle$ .

#### Case Part 2

### Sub-Case (APP6)

By Part 1 of the induction hypothesis, we know either  $e_0$  is a value, or there is a  $e_0'$  such that  $e_0 > e_0'$ . By Part 2 of the induction hypothesis, we know the same holds for  $e_1$ , with an additional possibility that  $e_1$  is a stuck term of the form  $F[Sk:\_.e]$ . Suppose  $e_0$  is a value. If  $e_1$  is also a value, the application is a  $\beta$ -redex and takes step. If  $e_1$  is a non-value that evaluates to  $e_1'$ ,  $e_0 e_1 > e_0 e_1'$ . If  $e_1$  is a stuck term, the whole application is also a stuck term  $e_0 F[Sk:\_.e]$ .

### Sub-Case (Shift)

By Part 2 of the induction hypothesis, we know e is either a value, or there is a e' such that  $e \triangleright e'$ , or it is a stuck term of the form  $F[Sk:\_.e']$ . In the first and third cases, the entire shift construct is a stuck term. In the second case,  $Sk:A \rightarrow \alpha.e \triangleright Sk:A \rightarrow \alpha.e'$ .

```
\begin{split} \Psi &::= \bullet \mid \Psi, \operatorname{Ind}(D:\kappa, \{c_i:C_i\}) \\ \Gamma &::= \bullet \mid \Gamma, x:A \mid \Gamma, x=A:e \\ \kappa &::= * \mid \overline{\Pi x_i:A_i}.* \\ \\ A,\alpha &::= \operatorname{Unit} \mid \overline{D \, \overline{e_i}} \mid \overline{\Pi x_i:A_i}.B \mid \Pi x:A.\alpha \parallel B \parallel \beta \\ \\ v &::= () \mid x \mid \lambda x:A.e \mid \operatorname{rec} f(x:A).e \mid \overline{c_i \, \overline{v_i}} \\ \\ e &::= v \mid e e \mid \operatorname{let} x=e:A \operatorname{in} e \mid \overline{c_i \, \overline{e_i}} \\ \mid \operatorname{match} e \operatorname{as} D \, \overline{a_i} \operatorname{in} x \operatorname{return} P \operatorname{with} \{c_i \, \overline{y_i} \to e_i\} \\ \mid \mathcal{S}k:A.e \mid \langle e \rangle \end{split}
```

Fig. 1.  $\lambda_{\Pi}^{s/r+}$  Syntax

# 2 $\lambda_{\Pi}^{s/r^+}$ : EXTENDING $\lambda_{\Pi}^{s/r}$ WITH MULTI-ARITY INDUCTIVE DATATYPES

This section shows how to support multi-arity datatype constants and constructors.

## 2.1 Syntax

Figure 1 defines the syntax of the extended language  $\lambda_{\Pi}^{s/r+}$ . The functional kind  $\Pi \, \overline{x_i : A_i}$ . \* abbreviates  $\Pi \, x_1 : A_1 . \, x_2 : A_2 . ... \, x_n : A_n . *$ , where each  $A_i$  may depend on preceding variables  $x_j$  where j < i. The kind represents the type of datatype constants that takes in n indices. That is, if constant D has such a type, it must be applied to a sequence of n terms  $\overline{e_i}$ . Function types  $\Pi \, \overline{x_i : A_i}$ . B are extended in a similar way, in order to support multi-argument constructors. Note that we do not extend the impure function type  $\Pi \, x : A$ .  $\alpha \parallel B \parallel \beta$ , because constructor application causes no effect other than the effect associated with the arguments. This is in contrast to function application, where the effect of the whole term may come from the function's body.

#### 2.2 Evaluation

Figure 2 shows changes in the rules for evaluation. The extended evaluation contexts tell us that when we have a constructor  $c_i$  applied to a sequence of arguments, we evaluate them from left to right.  $\iota$ -reduction happens when the scrutinee of a pattern matching construct is a constructor application to values, and the reduction involves sequential substitution. We use the notation  $e\left[\overline{v_i/x_i}\right]$  to mean replacing  $x_1$  in e with  $v_1$ , and then replacing  $x_2$  in the resulting term with  $v_2$ , and so on.

### 2.3 Typing Rules

We now define typing rules for the new constructs. The formation rules of functional kinds and types are a straightforward extension of their  $\lambda_{\Pi}^{s/r}$  counterpart: we simply type check each domain  $A_i$  (and the co-domain B) with a context extended with preceding variables. Rule (DATA) requires all indices  $e_i$  to be a pure term. Notice that each  $e_i$  has a type of the form  $A_i$   $[e_j/x_j]_p^i$ , which reads: for all j < i where  $e_j$  is a pure term, substitute  $e_j$  for  $x_j$  in  $A_i$ . We need this substitution because each  $A_i$  may depend on preceding variables. However, we should only substitute pure terms: remember that our language do not allow dependency on impure terms.

Rule (Const1) accounts for constructor application where all arguments are pure. The only change from  $\lambda_{\Pi}^{s/r}$ 's rule is that the result type is applied a sequential substitution. On the other

### **Evaluation Contexts**

$$E ::= ... | c_i v_1 ... E ... e_n$$
  
 $F ::= ... | c_i v_1 ... F ... e_n$ 

Substitution

$$e[\overline{e_i/x_i}] \stackrel{\text{def}}{\equiv} (...(e[e_1/x_1])[e_2/x_2]...)[e_n/x_n]$$

Reduction Rules

$$\Gamma \vdash \text{match } c_i \ \overline{v_i} \ \text{as x in D} \ \overline{a_i} \ \text{return P with } \{c_i \ \overline{y_i} \rightarrow e_i\} \quad \blacktriangleright_\iota \quad e_i \ [\overline{v_i/y_i}]$$

Fig. 2. 
$$\lambda_{\Pi}^{s/r+}$$
 Evaluation

hand, rule (Const2), where we have impure arguments, needs some non-trivial reasoning about the answer types  $\alpha_i$ ,  $\beta_i$ ,  $\alpha$ , and  $\beta$ . Formally, these types must satisfy the following conditions:

- If  $e_i$  is not the last impure argument,  $\alpha_i = \beta_j$ , where  $e_j$  is the closest impure argument following  $e_i$ .
- $\alpha = \alpha_i$ , where  $e_i$  is the last impure argument.
- $\beta = \beta_i$ , where  $e_i$  is the first impure argument.

To better understand the intuition behind these conditions, consider the following example, where we are applying the ::-constructor to a pure natural number and two impure lists:

$$\langle :: 0 \ (\mathcal{S}k_1 : \mathbb{N} \rightarrow L \ 2. :: 2 \ 10 \ (k_1 \ 30)) \ (\mathcal{S}k_2 : L \ 0 \rightarrow L \ 3. :: 1 \ 20 \ (k_2 \ nil)) \rangle$$

This term reduces is the following way:

```
\langle :: 0 \ (Sk_1. :: 2 \ 10 \ (k_1 \ 30)) \ (Sk_2. :: 1 \ 20 \ (k_2 \ nil)) \rangle
= \langle :: 2 \ 10 \ \langle :: 0 \ 30 \ (Sk_2. :: 1 \ 20 \ (k_2 \ nil)) \rangle \rangle
= \langle :: 2 \ 10 \ \langle :: 1 \ 20 \ \langle :: 0 \ 30 \ nil \rangle \rangle \rangle
= [10; \ 20; \ 30]
```

We first observe the chaining of argument answer types. In the above reduction sequence, we can see that the second shift happens when we call the continuation  $k_1$  captured by the first shift. According to the reduction rule of shift, we know that there is a reset surrounding the body of  $k_1$ , and what this reset returns is determined by how the second shift changes the answer type. Thus, we have  $\alpha_1 = \beta_2$ .

Next, we turn our attention to the initial answer type of the entire application. Observe that before evaluation, we have a term of type L 1 in the reset clause. In the above sequence, we obtain a singleton list when we call the continuation  $k_2$  captured by the second shift. This gives us  $\alpha = \alpha_2$ 

Lastly, we look at the final answer type. We find that elimination of the first shift changes the answer type from L 1 to L 3, and that the new answer type does not change in the subsequent steps. This is because elimination of the second shift happens in the application of  $k_1$ : since the body of  $k_1$  is surrounded by a reset, the second shift cannot touch the L 3-returning computation. Hence we have  $\beta = \beta_1$ .

$$\frac{\vdash \Psi \quad \bullet \vdash \Pi \: \overline{a_i : A_i}, * \quad (\bullet \vdash \Pi \: \overline{y_i : B_i}, D \: u_i : *)_{i=1...k}}{D, c_i \: fresh \quad safe(D, B_i)} \\ \vdash \Psi, Ind(D : \Pi \: \overline{a_i : A}, *, \{c_i : \Pi \: \overline{y_i : B_i}, D \: u_i\}) \\ \vdash \Psi, Ind(D : \Pi \: \overline{a_i : A}, *, \{c_i : \Pi \: \overline{y_i : B_i}, D \: u_i\}) \\ \vdash \Pi \: \overline{x_i : A_i} : * \quad \Gamma, x_1 : A_1 \vdash A_2 : * \dots \: \Gamma, x_i : A_i \vdash A_n : * \\ \hline \Gamma \vdash \Pi \: \overline{x_i : A_i} : * \\ \hline \vdash \Pi \: \overline{u_i : A_i} : * \quad \{c_i : C_i\}\} \in \Psi \quad (\Gamma \vdash_p \: e_i : A_i \: \overline{[e_j/x_j]_p^i})_{i=1...n} \quad (DATA) \\ \hline \vdash \Gamma \: D \: \overline{e_i} : * \\ \hline \vdash \Gamma \: Ind(D : \mathcal{K}, \{c_i : \Pi \: \overline{y_i : B_i}, D \: \overline{u_i}\}) \in \Psi \quad \Gamma \vdash_p \: e_i : B_i \: \overline{[e_j/x_j]_p^i} \quad (Const1) \\ \hline \vdash \Gamma \: Ind(D : \mathcal{K}, \{c_i : \Pi \: \overline{y_i : B_i}, D \: \overline{u_i}\}) \in \Psi \quad \Gamma \vdash_p \: e_i : B_i \: \overline{[e_j/x_j]_p^i} \quad (Const1) \\ \hline \vdash \Gamma \: Ind(D : \mathcal{K}, \{c_i : \Pi \: \overline{y_i : B_i}, D \: \overline{u_i}\}) \in \Psi \quad \Gamma \vdash_p \: e : D \: \overline{u} \\ \hline \Gamma \vdash_p \: e_i : B_i \: \overline{[e_j/x_j]_p^i} \; \beta \quad (Const2) \\ \hline \Gamma \colon_{\rho} \: e_i : B_i \: \overline{[e_j/x_j]_p^i} \; \beta \quad (Const2) \\ \hline \Gamma \colon_{\rho} \: e_i : B_i \: \overline{[e_j/x_j]_p^i} \; \beta \quad (Const2) \\ \hline \Gamma \colon_{\rho} \: a_i : A_i, x : D \: \overline{a_i} \vdash_{\rho} : P \: \overline{u_i/a_i} \: \overline{[e_i : y_i/x]_{p_i : B_i...}} \quad (Match1) \\ \hline \Gamma \vdash_p \: match \: e \: as \: x \: in D \: \overline{a_i} \: return P \: with \{c_i \: \overline{y_i} \to_e_i : P \: \overline{[u_i/a_i]} \: [e_i \: y_i/x]_{p_{i=1...k}} \\ \hline \Gamma \colon_{\rho} \: \overline{u_i/a_i} \: \overline{[e_i/x_j]} \: e_i : P \: \overline{[u_i/a_i]} \: \overline{[e_i/y_i/x]_{p_i : B_i...}} \quad (Match2) \\ \hline \Gamma \colon_{\rho} \: \overline{u_i/a_i} \: \overline{[e_i/x_j]} \: e_i : P \: \overline{[u_i/a_i]} \: \overline{[e_i/y_i/x]_{p_i : B_i...}} \quad (Match2) \\ \hline \Gamma \colon_{\rho} \: \overline{u_i/a_i} \: \overline{[e_i/x_j]} \: e_i : P \: \overline{[u_i/a_i]} \: \overline{[e_i/x_j]_{p_i : B_i...}} \quad (Match2) \\ \hline \Gamma \colon_{\rho} \: \overline{u_i/a_i} \: \overline{[e_i/x_j]} \: e_i : P \: \overline{[u_i/a_i]} \: \overline{[e_i/x_j]_{p_i : B_i...}} \quad (Match2) \\ \hline \Gamma \colon_{\rho} \: \overline{u_i/a_i} \: \overline{[e_i/x_j]} \: e_i : P \: \overline{[u_i/a_i]} \: \overline{[e_i/x_j]_{p_i : B_i...}} \quad (Match2) \\ \hline \Gamma \colon_{\rho} \: \overline{u_i/a_i} \: \overline{[e_i/x_j]} \: e_i : P \: \overline{[u_i/a_i]} \: \overline{[e_i/x_j]_{p_i : B_i...}} \quad (Match2) \\ \hline \Gamma \colon_{\rho} \: \overline{u_i/a_i} \: \overline{[e_i/x_j]} \: e_i : P \: \overline{[u_i/a_i]} \: e_i : P \: \overline{[u_i/a_i]} \: \overline{[e_i/x_j]_{p_i : B_i...}} \quad (P \colon_{\rho} \: e_i : P \: \overline{[u_i/a_i]} \: e_i : P \colon_{\rho} \: e_i : P$$

Fig. 3.  $\lambda_{\Pi}^{s/r+}$  Typing

# 3 $\lambda_{\Pi}^{K}$ : TARGET LANGUAGE OF CPS TRANSLATION

This section presents the complete specification of  $\lambda_{\Pi}^{k}$ , the target language of the CPS translation.

## 3.1 Syntax

```

Fig. 7. Well-formed Signatures, Typing Environments, Kinds, and Types

Note that  $\mathbf{e} \triangleright_{adm}^{\star} \mathbf{e}'$  in rule [REC] means  $\mathbf{e}$  reduces to  $\mathbf{e}'$  after administrative reductions. The set of administrative redexes  $\mathbf{r}$  are defined as follows:

```
\begin{array}{lll} r & ::= & m \ c \ | \ m \ A \ c \ | \ m \ @ A \ c \ | \ c \ v \\ \\ m & ::= & \lambda \ k : A. \ e \ | \ \lambda \alpha : *. \ \lambda \ k : A. \ e \\ \\ c & ::= & k \ | \ id \ | \ \lambda x : A. \ r \ | \ \lambda x : A. \ x \ x' \ k \ | \ \lambda x : A. \ x \ x' \ A \ k \\ \\ & | \ \lambda x : A. \ match \ x \ as \ x' \ in \ D \ a \ return \ P \ with \ \{c_i \ y_i \rightarrow r\} \\ \\ v & ::= & x \ | \ \lambda x : A. \ m \ | \ rec \ f \ (x : A). \ m \ | \ c_i \ v \end{array}
```

# Terms $\Gamma \vdash \mathbf{e} : \mathbf{A}$

Fig. 8. Typing Rules

#### 4 TYPE PRESERVATION OF THE CPS TRANSLATION

Lemma 4.1 (CPS Computation  $\eta$ ). If e is a pure term, then  $e^{\div} \equiv \lambda \alpha : *. \lambda k : A \rightarrow \alpha$ .  $e^{\div} @ \alpha (\lambda v : B. k v)$ 

By the construction of the CPS translation, we know that any pure term e is translated to a polymorphic function  $\lambda \alpha' : *. \lambda k' : A' \rightarrow \alpha'$ . e. The equivalence follows by the  $\eta$ -rule and the semantics of @.

LEMMA 4.2 (COMPOSITIONALITY). Suppose e' is a pure term.

(1) 
$$(\kappa [e'/x])^{+} \equiv \kappa^{+} [e'^{+} \underline{id/x}]$$
 (3)  $(e [e'/x])^{+} \equiv e^{+} [e'^{+} \underline{id/x}]$  (2)  $(A [e'/x])^{+} \equiv A^{+} [e'^{+} \underline{id/x}]$ 

The proof is by induction on the derivation of  $\kappa$ , A, and e. The only interesting case is when e = x, which uses the new equivalence rule:

$$(x [e'/x])^{\div} = e'^{\div}$$
 by substitution  

$$\equiv \lambda \alpha. \lambda k. e'^{\div} @ \alpha (\lambda x. k x)$$
 by Lemma 4.1  

$$\equiv \lambda \alpha. \lambda k. (\lambda x. k x) (e'^{\div} A'^{+} id)$$
 by  $[\equiv \text{-Cont}]$   

$$= (\lambda \alpha. \lambda k. (\lambda x. k x) x) [e'^{\div} A'^{+} id/x]$$
 by substitution  

$$\downarrow^{\star} (\lambda \alpha. \lambda k. k x) [e'^{\div} A'^{+} id/x]$$
 by  $\beta$ -reduction  

$$= x^{\div} [e'^{\div} A'^{+} id/x]$$
 by definition of translation

Notice that in the fifth step, we are substituting a non-value  $e'^{\frac{1}{2}}$  \_ id. This is why the target language must be call-by-name.

LEMMA 4.3 (CORRECTNESS).

```
(1) If Γ ⊢ κ and κ ▷ * κ', then κ + ≡ κ' +.
(2) If Γ ⊢ A : * and A ▷ * A', then A + ≡ A' +.
(3) If Γ ⊢ p e : A or Γ; α ⊢ e : A; β and e ▷ * e', then e = e' = e' +.
```

We first prove correctness with regard to single-step reduction, by cases on the >-relation, and then extend the result to multi-step reduction, by induction on the length of the reduction sequence.

Case Part 3 Sub-Case  $(\lambda x : A. e_0) v_1$  by (APP5)

```
 ((\lambda x. e_{0}) v_{1})^{\div} = \lambda k. (\lambda x. e_{0})^{\div} (\beta [v_{1}/x])^{+} (\lambda v_{0}. v_{1}^{\div} @ (\beta [v_{1}/x])^{+} (\lambda v_{1}. v_{0} v_{1} k)) 
 = \lambda k. (\lambda \alpha. \lambda k. k (\lambda x. e_{0}^{\div})) (\beta [v_{1}/x])^{+} (\lambda v_{0}. v_{1}^{\div} @ (\beta [v_{1}/x])^{+} (\lambda v_{1}. v_{0} v_{1} k)) 
 \triangleright_{\beta}^{\star} \lambda k. v_{1}^{\div} @ (\beta [v_{1}/x])^{+} (\lambda v_{1}. (\lambda x. e_{0}^{\div}) v_{1} k) 
 \triangleright_{\beta} \lambda k. v_{1}^{\div} @ (\beta [v_{1}/x])^{+} (\lambda v_{1}. (e_{0}^{\div} [v_{1}/x]) k) 
 \equiv \lambda k. (\lambda v_{1}. (e_{0}^{\div} [v_{1}/x]) k) (v_{1}^{\div} A^{+} id) 
 \triangleright_{\beta} \lambda k. (e_{0}^{\div} [v_{1}^{\div} A^{+} id/x]) k 
 \equiv e_{0}^{\div} [v_{1}^{\div} A^{+} id/x] 
 by \eta\text{-equivalence} 
 \equiv (e_{0} [v_{1}/x])^{\div} 
 by Lemma 4.2
```

```
Sub-Case match c_i v as x in D a return P with \{c_i \ y_i \rightarrow e_i\} \triangleright e_i [v/y_i] by (MATCH2)

                                                               (\langle Sc : A \rightarrow \alpha. e \rangle)^{+}
                                                                = \lambda \alpha. \lambda k. k ((Sc: A \rightarrow \alpha. e)^{+} id)
                                                                = \lambda \alpha. \lambda k. k ((\lambda k. e^{\frac{1}{2}} id [\lambda x. \lambda \alpha'. \lambda k'. k' (k x)/c]) id)
                                                                \triangleright_{\beta} \lambda \alpha. \lambda k. k (e^{\div} id [\lambda x. \lambda \alpha'. \lambda k'. k' x/c])
```

$$(\langle \mathbf{e} [\lambda \mathbf{x} : \mathbf{A} . \mathbf{x}/\mathbf{c}] \rangle)^{\div}$$

$$= \lambda \alpha. \lambda \mathbf{k} . \mathbf{k} . (\langle \mathbf{e} [\lambda \mathbf{x} : \mathbf{A} . \mathbf{x}/\mathbf{c}] \rangle)^{\div} i\mathbf{d})$$

$$\equiv \lambda \alpha. \lambda \mathbf{k} . \mathbf{k} . (\langle \mathbf{e}^{\div} [\lambda \mathbf{x} . \lambda \alpha' . \lambda \mathbf{k}' . \mathbf{k}' \mathbf{x}/\mathbf{c}] \rangle) i\mathbf{d}) \qquad \text{by Lemma 4.2}$$

$$= \lambda \alpha. \lambda \mathbf{k} . \mathbf{k} . (\langle \mathbf{e}^{\div} [\lambda \mathbf{x} . \lambda \alpha' . \lambda \mathbf{k}' . \mathbf{k}' \mathbf{x}/\mathbf{c}] \rangle) \qquad \text{by substitution}$$

Note that the domain of **id** in the second-last line is  $(B [\lambda x : A. x/c])^+$ , and the domain of **id** in the last line is  $B^+ [\lambda x : A^+. \lambda \alpha' : *. \lambda k : A^+ \rightarrow \alpha'. k' x/c]$ . These types are equivalent by Lemma 4.2.

Sub-Case ⟨v⟩ ▷ v

$$\langle \mathbf{v} \rangle^{\div} = \lambda \alpha. \lambda \mathbf{k}. \mathbf{k} (\mathbf{v}^{\div} \mathbf{id}) \qquad \equiv \lambda \alpha. \lambda \mathbf{k}. \mathbf{k} (\mathbf{v}^{\div} \mathbf{id}) \qquad \text{by Lemma 1.13}$$

$$\mathbf{v}^{\div} = \lambda \alpha. \lambda \mathbf{k}. \mathbf{v}^{\div} @ \alpha (\lambda \mathbf{v}. \mathbf{k} \mathbf{v}) \qquad \qquad \text{by Lemma 1.13 and 4.1}$$

$$\equiv \lambda \alpha. \lambda \mathbf{k}. (\lambda \mathbf{v}. \mathbf{k} \mathbf{v}) (\mathbf{v}^{\div} \mathbf{id}) \qquad \qquad \text{by Lemma 4.2}$$

$$\mathbf{v}_{\beta} \lambda \alpha. \lambda \mathbf{k}. \mathbf{k} (\mathbf{v}^{\div} \mathbf{id})$$

LEMMA 4.4 (COHERENCE).

(1) 
$$\kappa \equiv \kappa' \Rightarrow \kappa^+ \equiv \kappa'^+$$
 (2)  $A \equiv A' \Rightarrow A^+ \equiv A'^+$  (3)  $e \equiv e' \Rightarrow e^{\div} \equiv e'^{\div}$ 

In both  $\lambda_\Pi^{s/r}$  and  $\lambda_\Pi^k$ , equivalence is defined in terms of reduction. Since the translation is correct (Lemma 4.3), equivalent expressions in  $\lambda_\Pi^{s/r}$  are mapped to equivalent expressions in  $\lambda_\Pi^k$ .

THEOREM 4.5 (Type Preservation).

```
(1) \vdash \Psi \Rightarrow \vdash \Psi^{+}
(2) \vdash \Gamma \Rightarrow \vdash \Gamma^{+}
(3) \Gamma \vdash \kappa \Rightarrow \Gamma^{+} \vdash \kappa^{+}
(4) \Gamma \vdash A : * \Rightarrow \Gamma^{+} \vdash A^{+} : *
(5) \Gamma \vdash_{p} e : A \Rightarrow \Gamma^{+} \vdash e^{\div} : \Pi \alpha : * . (A^{+} \rightarrow \alpha) \rightarrow \alpha
(6) \Gamma; \alpha \vdash e : A; \beta \Rightarrow \Gamma^{+} \vdash e^{\div} : (A^{+} \rightarrow \alpha^{+}) \rightarrow \beta^{+}
```

The proof is by mutual induction on the derivation. Here we give some interesting cases:

Case Part 1

Sub-Case (EXTENDSIG)

We must show

```
\vdash \Psi^+, Ind(D : (\Pi a : A. *)^+, \{c_i : \Pi y_i : B_i^+, (D u_i)^+\})
```

By the induction hypothesis, we have  $\vdash \Psi^+, \bullet \vdash (\Pi \ a : A. *)^+, \text{ and } \bullet \vdash \Pi \ y_i : B_i^+. (D \ u_i)^+ : *.$  What remains to check is the two additional restrictions in the premise of [ExtendSig]. The first one, freshness of names, is trivially satisfied. The second one, strict positivity, is also satisfied, thanks to the safety condition of  $\lambda_{\Pi}^{s/r}$ . Suppose  $B_i$  is of the form  $\Pi \times : B_1 \cdot \alpha \parallel B_2 \parallel \beta$ . This type is converted into  $\Pi \times : B_1^+. (B_2^+ \to \alpha^+) \to \beta^+$ . We find that  $B_1^+, B_2^+$ , and  $\alpha^+$  appear in a negative position, but the safety condition safe(D,  $B_i$ ) guarantees that D does not occur in these types. This implies that strictly-positive(D,  $B_i^+$ ) holds.

Case (Extend2)

We must show

$$\vdash \Gamma^+, \mathbf{x} = \mathbf{e}^{\div} \mathsf{A}^+ \mathbf{id} : \mathsf{A}^+$$

By the induction hypothesis, we have  $\vdash \Gamma^+, \Gamma^+ \vdash A^+ : *$ , and  $\Gamma^+ \vdash e^{\div} : \Pi \alpha : * . (A^+ \to \alpha) \to \alpha$ . The last hypothesis implies  $\Gamma^+ \vdash e^{\div} A^+ \text{ id} : A^+$ . The goal follows by [EXTEND2].

Case Part 4

Sub-Case (DATA)

We must show

$$\Gamma^+ + \mathbf{D} \, \mathbf{e_i}^+ \, \mathbf{A_i}^+ \, \mathbf{id} : *$$

Since  $D:\Pi \ y_i:A_i.*$ , we have  $D:(\Pi \ y_i:A_i.*)^+=\Pi \overline{y_i:A_i^+}.*$ . By [Data], we know that all  $e_i$  are pure, and the induction hypothesis gives us  $e_i^{\div} \ A_i^+$  id  $:A_i^+$ . This implies that the translated type is well-formed.

Sub-Case (PiT2)

We must show

$$\Gamma^+ \vdash \Pi \mathbf{x} : \mathsf{A}^+ . (\mathsf{B}^+ \to \alpha^+) \to \beta^+ : *$$

By the induction hypothesis, we have  $\Gamma^+ \vdash A^+ : *, \Gamma^+, \mathbf{x} : A^+ \vdash B^+ : *$ , and similarly for  $\alpha^+$  and  $\beta^+$ . The goal follows by [P<sub>1</sub>T<sub>1</sub>].

Case Part 5

Sub-Case (VAR)

Our goal is to show

$$\Gamma^+ \vdash \lambda \alpha : *.\lambda k : A^+ \rightarrow \alpha.k x : \Pi \alpha : *.(A^+ \rightarrow \alpha) \rightarrow \alpha$$

By the induction hypothesis, we have  $\vdash \Gamma^+$  and  $\mathbf{x} : A^+ \in \Gamma^+$  or  $\mathbf{x} = e^{\div} A^+$  id  $: A^+ \in \Gamma^+$ . By [Var], we have  $\Gamma^+ \vdash \mathbf{x} : A^+$ , which means the application  $\mathbf{k} \times \mathbf{x}$  is well-typed. Now the goal immediately follows.

Sub-Case (ABS2)

Our goal is to show

$$\lambda \alpha : *. \lambda \mathbf{k} : (\Pi \mathbf{x} : A. \alpha \parallel B \parallel \beta)^+ \rightarrow \alpha. \mathbf{k} (\lambda \mathbf{x} : A^+. e^{\div})$$

has type

$$\Pi \alpha : *. ((\Pi x : A. \alpha || B || \beta)^+ \rightarrow \alpha) \rightarrow \alpha$$

under context  $\Gamma^+$ . By the induction hypothesis,  $\Gamma$ ,  $\mathbf{x}: A^+ \vdash e^{\div}: (B^+ \to \alpha^+) \to \beta^+$ . The goal follows by [ABS1].

Sub-Case (APP1)

Our goal is to show the term

$$\lambda \alpha : *. \lambda k : (B[e_1/x])^+ \rightarrow \alpha . e_0^{\pm} \alpha (\lambda v_0 : (\Pi x : A. B)^+. e_1^{\pm} @ \alpha (\lambda v_1 : A^+. v_0 v_1 \alpha k))$$

has type  $\Pi \alpha: *.((B [e_1/x])^+ \to \alpha) \to \alpha$  under context  $\Gamma^+$ . By compositionality (Lemma 4.2), we have  $(B [e_1/x])^+ \equiv B^+ [e_1^{\div} A^+ id/x]$ . By Part 5 of the induction hypothesis, we have  $e_0^{\div}: \Pi \alpha: *.((\Pi x:A,B)^+ \to \alpha) \to \alpha$  and  $e_1^{\div}: \Pi \alpha: *.(A^+ \to \alpha) \to \alpha$ . These imply  $\mathbf{v_0} \ \mathbf{v_1}: B^+ [\mathbf{v_1/x}]$ . Since we type application of  $e_1^{\div}$  to its continuation using [T-Cont], we can type  $\mathbf{v_0} \ \mathbf{v_1}$  under the assumption that  $\mathbf{v_1} = e_1^{\div} A^+ id$ . This implies that  $\mathbf{v_0} \ \mathbf{v_1} \ \mathbf{k}$  is well-typed.

Sub-Case (MATCH1)

Our goal is to show the term

$$\begin{array}{l} \lambda\,\alpha:*.\,\lambda\,k:(P\,[u/a,\,e/x])^+\to\alpha.\\ e^{\div}\,\,@\,\alpha\,(\lambda\,v:(D\,u)^+.\,match\,\,v\,\,as\,\,x\,\,in\,\,D\,\,a\,\,return\,\,\alpha\,\,with\,\,\{c_i\,\,\overline{y_i}\to e_i^{\,\div}\,\,\alpha\,\,k\}) \end{array}$$

has type

$$\Pi \alpha : *. ((P[u/a, e/x])^+ \rightarrow \alpha) \rightarrow \alpha$$

under context  $\Gamma^+$ . By [T-Cont] and [Match], it suffices to show that each branch  $e_i^{\dot{+}} \alpha k$  has type  $\alpha$  under  $\Gamma^+$  extended with the following information:

```
\alpha: *, \mathbf{k}: (P[\mathbf{u}/\mathbf{a}, \mathbf{e}/\mathbf{x}])^+ \rightarrow \alpha, \mathbf{v} = \mathbf{e}^{\div} (D \mathbf{u})^+ \mathbf{id}: (D \mathbf{u})^+, \mathbf{y}_i: B_i^+, \mathbf{u}^{\div} A^+ \mathbf{id} \equiv \mathbf{u}_i^{\div} A^+ \mathbf{id}, \mathbf{v} \equiv \mathbf{c}_i \mathbf{y}_i
```

By the induction hypothesis,  $e_i^{\div}$  has the following type:

$$\Pi \alpha : *. ((P[u_i/a, c_i y_i/x])^+ \rightarrow \alpha) \rightarrow \alpha$$

Now, let us prove that  $(P[u_i/a, c_i y_i/x])^+$  is equivalent to the domain of the continuation **k**:

$$(P [u_i/a, c_i y_i/x])^+ \equiv P^+ [u_i^{\div} \_ id/a, (c_i y_i)^{\div} \_ id/x] \qquad \text{by Lemma 4.2}$$

$$\triangleright_{\beta}^{\star} P^+ [u_i^{\div} \_ id/a, c_i y_i/x]$$

$$\equiv P^+ [u_i^{\div} \_ id/a, v/x] \qquad \text{by } v \equiv c_i y_i$$

$$\equiv P^+ [u^{\div} \_ id/a, v/x] \qquad \text{by } u^{\div} \_ id \equiv u_i^{\div} \_ id$$

$$\triangleright_{\delta} P^+ [u^{\div} \_ id/a, e^{\div} (D u)^+ id/x]$$

$$\equiv (P [u/a, e/x])^+ \qquad \text{by Lemma 4.2}$$

The rule [MATCH] gives us the information  $u^{\div}$  \_ id  $\equiv u_i^{\div}$  \_ id and  $v \equiv c_i \ y_i$ . Since (MATCH1) requires a pure scrutinee e, we further know that v is the result of running  $e^{\div}$  with the identity continuation. This knowledge is made explicit by [T-Cont], allowing us to  $\delta$ -reduce v to  $e^{\div}$  (D u) $^+$  id. Thus we conclude that the translation of the matching construct has the correct type.

## Sub-Case (RESET)

Our goal is to show

$$\Gamma^+ \vdash e^{\div} (\lambda \mathbf{x} : \mathbf{B}^+, \mathbf{x}) : \Pi \alpha : *. (\mathbf{A}^+ \to \alpha) \to \alpha$$

By Part 5 of the induction hypothesis, we have

$$\Gamma^+ \vdash e^{\div} : (B^+ \rightarrow B^+) \rightarrow A^+$$

The goal immediately follows.

### Sub-Case (Conv1)

Our goal is to show

$$\Gamma^+ \vdash e^{\div} : \Pi \alpha : *. (B^+ \rightarrow \alpha) \rightarrow \alpha$$

By Part 5 of the induction hypothesis, we have

$$\Gamma^+ \vdash e^{\div} : \Pi \alpha : *. (A^+ \rightarrow \alpha) \rightarrow \alpha$$

The goal follows by the coherence property (Lemma 4.4).

### Case Part 6

## Sub-Case (Let2)

Our goal is to show

$$\lambda \mathbf{k} : (B[e_1/x])^+ \to (\alpha [e_1/x])^+ . e_1^+ @ (\beta [e_1/x])^+ (\lambda \mathbf{x} : A^+ . e_2^+ \mathbf{k})$$

has type

$$((B[e_1/x])^+ \rightarrow (\alpha[e_1/x])^+) \rightarrow (\beta[e_1/x])^+$$

under context  $\Gamma^+$ . By compositionality, we have  $(B[e_1/x])^+ \equiv B^+[e_1^+ A^+ id/x]$  and similarly for the answer types. By Parts 5 and 6 of the induction hypothesis, we have

$$\Gamma^+ \vdash e_1^{\div} : \Pi \alpha : *. (A^+ \rightarrow \alpha) \rightarrow \alpha$$

and

$$\Gamma^+, \mathbf{x} = \mathbf{e}_1^{\div} \mathsf{A}^+ \mathbf{id} : \mathsf{A}^+ \vdash \mathbf{e}_2^{\div} : (\mathsf{B}^+ \to \alpha^+) \to \beta^+$$

Since we type the application of  $e_1^{\div}$  using [T-Cont], we can type  $e_2^{\div}$  **k** under the assumption that  $\mathbf{x} = e_1^{\div} A^{+}$  **id**. This implies that  $e_2^{\div}$  **k** is type-safe.

# 5 CPS TRANSLATION OF $\lambda_{\Pi}^{ m s/r^+}$

This section shows how to scale the CPS translation to multi-arity inductive datatypes. As in  $\lambda_{II}^{s/r}$ , the key idea is to convert pure arguments using the polymorphic answer type translation so that we can use the free theorem to reason about their CPS images.

Extending the translation is straightforward in most cases; the only case that requires non-trivial reasoning is (Const2). This rule concludes with a constructor application, where some arguments are pure and some are impure. Recall that a pure argument  $e_i$  may appear in the type of subsequent arguments as well as the result type. This means we have to give  $e_i^{\,\dot{\tau}}$  a polymorphic type, and instantiate its answer type when applying  $e_i^{\,\dot{\tau}}$  to its continuation. In our translation, we use a new application form  $e_i^{\,\dot{\tau}}$  to perform answer type instantiation. The application is defined as follows:

- When  $e_i$  is impure,  $e_i^{\div} \bullet_a k = e_i^{\div} k$ .
- When  $e_i$  is pure and there is an impure argument preceding  $e_i$ ,  $e_i^{\, \div} \, \bullet_a \, \mathbf{k} = e_i^{\, \div} \, ( \omega \, \alpha_j^{\, +} \, \mathbf{k} )$  or  $e_i^{\, \div} \, \alpha_i^{\, +} \, \mathbf{k}$  where  $e_i$  is the closest impure argumet preceding  $e_i$ .

Since the typing rule applies when at least one argument is impure, one of the above three cases must hold. If  $e_i$  is impure, there is no need to instantiate the answer type, hence we simply apply  $e_i^{\,\dot{}}$  to  $\mathbf{k}$ . If there is an impure argument  $e_j$  following  $e_i$ , the application of  $e_j^{\,\dot{}}$  to its continuation must have type  $\beta_j^{\,\dagger}$ , where  $\beta_j^{\,\dagger}$  is the final answer type of  $e_j^{\,\dagger}$ . This type will be the return type of the continuation passed to  $e_i^{\,\dot{}}$ , therefore we instantiate the answer type of  $e_i^{\,\dot{}}$  to  $\beta_j^{\,\dagger}$ . Note that we use @ when  $e_i^{\,\dagger}$  appears in types, that is, when the constructor's i'th domain is  $y_i^{\,\dagger}$ . B<sub>i</sub> and  $y_i^{\,\dagger}$  is bound by  $\Pi$ . If there is an impure argument  $e_j^{\,\dagger}$  preceding  $e_i^{\,\dagger}$ ,  $e_j^{\,\dot{}}$  requires a continuation that returns  $\alpha_j^{\,\dagger}$ , where  $\alpha_j^{\,\dagger}$  is the initial answer type of  $e_j^{\,\dagger}$ . As  $e_i^{\,\dagger}$  is pure and thus does not change the answer type, application  $e_i^{\,\dagger}$  @  $\alpha_j^{\,\dagger}$  k has type  $\alpha_j^{\,\dagger}$ , which guarantees that  $e_j^{\,\dagger}$  ( $\lambda \, \mathbf{v}_j^{\,\dagger}$ ,  $e_i^{\,\dagger}$  @  $\alpha_j^{\,\dagger}$  k) is well-typed.

The translation of  $\lambda_{\Pi}^{s/r+}$  signatures, kindes, types, and terms are presented in Figure 9.
